

Our Future Organizational Design

To scale nnamu into the future

Our organization must be designed in a way that we can achieve our vision & mission.

Vision

Shaping tomorrow: leading the tech revolution in strategy consulting, powered by AI.

Mission

Unlocking the potential of businesses with AI-powered strategic advantage.

Our North Star is...

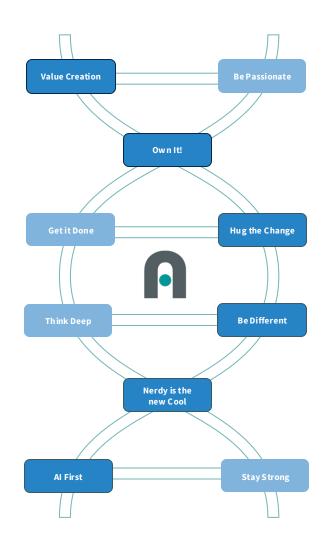

An organizational design that enables us to maintain an unwavering focus on our customers.

A structure of unparalleled agility, which can swiftly respond to any change, and ignite our imagination to achieve an enlightened state of continuous iteration and growth.

nnamu

Our values define the guiding principles of our organizational design.

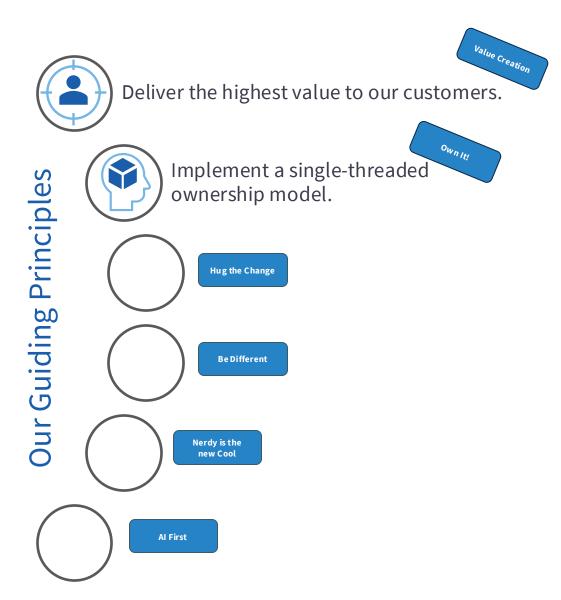

Our products are built for our customers by our customers.

We must remain well-informed and actively listen to our customers' needs and feedback.

We need an organizational design that enables us to:

- Develop a deep expertise of our own products
- Listen to our customers.
- Develop products by knowing what our customers need rather than assuming it.

In nnamu, Everything is a Product

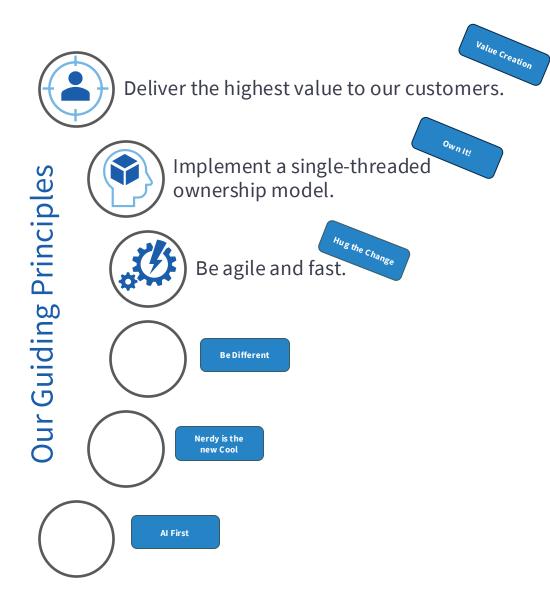

All the building blocks and components that make up our products are drivers of value.

- Each one has its own customer journey, whether the customer is external or internal.
- And thus, they must be developed and continuously improved as products.

We need an organizational design that:

- Gives products the dedicated team and attention they deserve.
 - Implement a Single-Threaded Ownership model, more on this later.
- Empowers owners to build the best possible products.

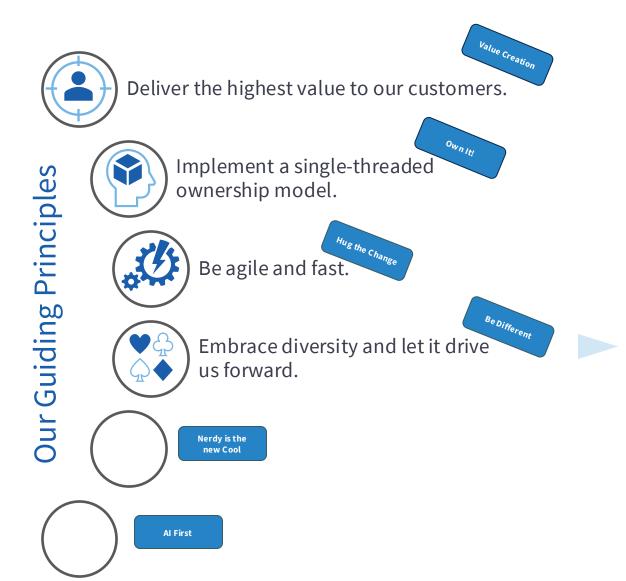

Our operating environment is fast-paced and ambiguous.

nnamu's success hinges on our ability to be fast and react swiftly to change.

We must create an organizational design that enables us to:

- Quickly identify any change in customer needs and/or environment.
- Rapidly deploy and execute product iterations so to seamlessly adapt to these changes.
- Remove unnecessary dependencies and blockers that inhibit our speed.

Our customer base is wide and diverse.

To effectively understand and serve them, we must reflect that diversity in our organizational design.

We will build a team composed of diverse backgrounds and skillsets so that:

- We bring different and unique perspectives in product development
- We foster innovation
- We enhance our ability to meet the evolving needs of our customers.

Al First

Innovation never stops

A product is never truly finished, otherwise the concept of innovation wouldn't exist.

To stay ahead of the competition, we must never stop iterating and making our products the best they can possibly be.

To do so, our organizational design must:

- Empower us to iterate and experiment with our products
- Foster ownership of a product

"AI First" extends beyond our processes and culture.

Al should be integrated within our company architecture.

We will leverage AI to automate specific architectural functions that would be traditionally performed by humans.

- AI will be considered a product owner of specific functions within our organization.
- We prioritize AI over increasing headcount.

The Skill-based Traditional organization design doesn't meet our guiding principles

Dividing people based on their skills and roles causes companies to become slow and inefficient when they scale.

Traits of a

Slow

Company

₩

Misalignment of Priorities

Skill teams freely choose which tasks to complete first, often choosing differently than other teams.

Product development is blocked by misaligned task completion from the different skill teams

Jack-of-all-Trade Teams

Skill teams continuously switch between projects and tasks, never fully becoming experts on any.

- Continuous iteration and growth is practically impossible
- Hard to truly identify problems in products

Fragmented Attention

The Program or Project manager is tasked with juggling multiple projects, all competing for his time and attention. Leading to:

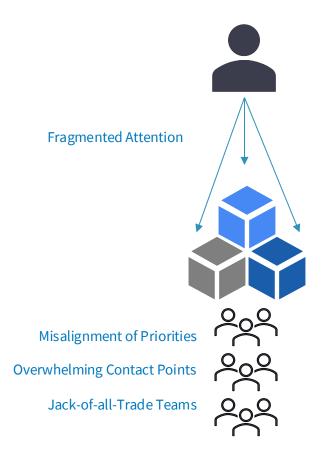

- Projects being completed in a slower timeframe.
- Not iterating to improve the project once "completed".

Overwhelming Contact Points

As products grow, teams become too large to effectively work together.

Consider that:

- 6-person teams have 15 connections
- 50-person teams have 1,225 connections

The Skill-based Traditional organization design doesn't meet our guiding principles

Dividing people based on their skills and roles causes companies to become slow and inefficient when they scale.

Jack-of-all-Trade Teams

Single-Threaded Owners (STO) and Product-based teams are the core of a modern, agile organization.

Single-Threaded Owners

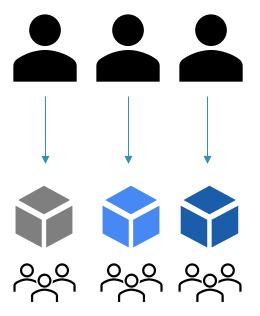

A single-threaded owner is a leader who is 100% dedicated and accountable to a specific product.

- (Ideally) Responsible for only one product
- Responsible for all the decisions for the product
- Directly managefs all the resources required to execute the product
- Delineates the work and priorities to execute the product
- Controls the pace and scope of the product

Product-Based Teams

Product teams are teams capable of owning the entire product development cycle from ideation through operations.

- Two-Pizza teams Teams of no more than 5-10 people
- Cross-functional The team has all the necessary resources to develop and ship the product and future iterations.
- Autonomous We reduce dependencies with other teams as much as possible so that product teams are empowered to perform at their pace and not to someone elses.

The Single-Threaded Owner is the pace-setter of the product team.

The STO is NOT your new boss.

Consider a dragon-boat drummer:

The dragon-boat race is an event that occurs in China where boats of ~50 rowers compete against each other in a race.

In these "dragon-boat" teams:

- The large number of rowers can't perform effectively without the drummer setting the pace.
- The drummer can't move the boat alone.

"The best way to fail at inventing something is by making it somebody's part-time job."

> - David Limp, Senior Vice President of Devices and Service at Amazon

Product teams creating value

STO setting the pace

The goal of a product team is to maximize the user experience of their product through continuous iteration

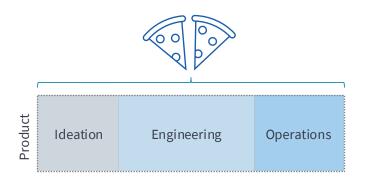

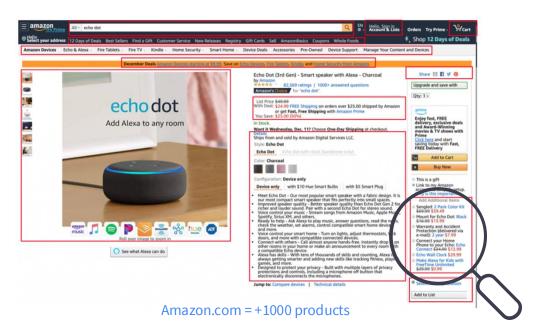

First step is dividing the full "traditional" product into components small enough for a 2-pizza team to own.

These multidisciplinary teams than operate just like a mini startup, owning the entire development life-cycle from ideation through operations.

Post development, product teams don't move on to something different but instead continue to iterate and improve the product.

• Instead, they work on making that product as attractive as it can be by focusing on customer experience and feedback

A Product-Based Single-Threaded Organization

It will take time to achieve our design vision, for now we will work on the first steps.

First steps to make our organizational design vision happen:

- Review our Development Life-Cycle to identify bottlenecks, dependencies and inefficiencies.
- Slowly introduce product teams for our upcoming products, following Andromeda.
 - Assign the STO to define the requirements to develop the product
 - Build the product team required
- Going forward, we will hire for teams rather than role.
